44. Extreme points on flattened spheres The equation  $x^{2n} + y^{2n} + z^{2n} = 1$ , where  $n$  is a positive integer, describes a flattened sphere. Define the extreme points to be the points on the flattened sphere with a maximum distance from the

In calculus, Leibniz's notation, named in honor of the 17th-century German philosopher and mathematician Gottfried Wilhelm Leibniz, uses the symbols  $dx$  and  $dy$  to represent infinitely small (or infinitesimal) increments of  $x$  and  $y$ , respectively, just as  $\Delta x$  and  $\Delta y$  represent finite increments of  $x$  and  $y$ , respectively.. Consider  $y$  as a function of a variable  $x$ , or  $y = f(x)$ .

Relative growth rate (RGR) is growth rate relative to size. It is also called the exponential growth rate, or the continuous growth rate. In terms of differential equations, if  $S$  is the current size, and its growth rate, then relative growth rate is  $\frac{dS}{dt} = rS$ . If the relative growth rate is constant, i.e.,  $r$ , it is not difficult to verify that a solution to this equation is  $S(t) = S_0 e^{rt}$ .

Vers la fin du XVI<sup>e</sup> siècle, le développement de l'astronomie et de la navigation d'une part et les calculs bancaires d'intérêts composés d'autre part [1], poussent les mathématiciens à chercher des méthodes de simplifications de calculs et en particulier le remplacement des multiplications par des sommes. Utilisant les tables trigonométriques, les mathématiciens Paul Wittich (1546 ...

Razão e definição. A ideia dos logaritmos é reverter a operação de exponenciação, isto é, elevar um número a uma potência. [14] A título de exemplo, a potência de três (ou o cubo) de 2 é 8, porque 8 é o produto dos três fatores de 2:  $2^3 = 2 \times 2 \times 2$ . Disso resulta que o logaritmo de 8 na base 2 é 3, ou seja: [16]  $\log_2 8 = 3$ . Exponenciação. A potência de três de qualquer ...
